CopyPasteBin

More control before you paste

CopyPasteBin helps you notice sensitive information in copied text before it reaches a chat, email, document, or terminal. Analysis runs locally, and the decision always stays with you.

Why use it

1. **Notice risk earlier**
   A warning appears when text resembles a supported kind of sensitive information.
2. **Keep the decision**
   The tool helps you review text, but it does not paste it or change the clipboard automatically by default.
3. **Keep data on your device**
   Detection and redaction run without sending clipboard contents to cloud services.
4. **Prepare safer text**
   Safe Paste and the editor help remove or redact selected values before you share them.

In everyday work

Copy as usual. CopyPasteBin works in the background and gives you a moment to review text before using it in a conversation, message, document, or command.

Copy with more confidence | Paste with more awareness

You stay in control

CopyPasteBin warns and suggests edits, but saving a replacement requires an explicit action. Optional clearing of an unchanged warning-triggering clipboard entry works only after the user enables it.

Honest protection boundaries

No warning means only that no known, enabled pattern matched. CopyPasteBin helps reduce risk, but it cannot guarantee detection of all sensitive information and does not block pasting.

GNOME Shell 50 | Wayland | English and Polish
